

Level Intelligence OS

The pain points

Signals are scattered

Opportunities start in permits, planning, RFQs, brokers, brands, and relationships.

Judgment is trapped

Context lives in people, inboxes, spreadsheets, and project memory.

Leadership chases status

Executives need exceptions, decisions, risks, and next actions in one place.

Outcomes, not just code

Code is the mechanism. The product is a working operating rhythm: visible pipeline, cleaner RFQ decisions, approval rails, weekly executive briefs, and compounding operating memory.

Feasibility

High feasibility

Build above current tools first.

Main risk

Data quality and adoption.

Best wedge

Pipeline, RFQs, briefs.

What Level gets

- Earlier signal detection across permits, planning, title changes, development news, broker notes, franchise expansion, and RFQs.
- Level-specific qualification scoring across geography, relationship strength, margin potential, entitlement risk, financing fit, and strategic value.
- Agent workflows for scouting, relationship briefs, RFQ summaries, go/no-go memos, permit follow-ups, executive briefs, and handoffs.
- Human approval rails for outreach, bid submission, vendor award, budget change, investor communication, and legal decisions.

Why this matters now

- Software is becoming internal and company-specific again.
- Language is now a software interface, so messy emails, RFQs, permit comments, and notes become structured work.
- Level can add, omit, and reshape workflows faster when it owns the operating layer.
- Every decision and outcome becomes training material for better future recommendations.

Value props and compounding loop

Faster pursuit

Signals become opportunities with owners, scores, and next actions.

Better margin

Go/no-go discipline reduces wasted pursuits and highlights risk earlier.

Lower admin load

Agents summarize, extract, draft, route, and remind across language-heavy work.

Outcome delivery

Success is measured by operating lift, not by handing over a codebase.

Improve

Every outcome sharpens the next score, brief, alert, and recommendation.

Term sheet skeleton

Engagement	90-day pilot to design and build Level Intelligence OS v1.
Pilot scope	Opportunity pipeline, account/contact layer, signal inbox, qualification scoring, RFQ intake, approval queue, weekly executive brief.
Deliverables	Data model, working interface, agent workflows, pilot report, success metrics, and phase-two roadmap.
Ownership	Level owns its data and generated operating memory. Code/licensing structure to be finalized in agreement.
Commercial options	Fixed-fee pilot, build fee plus monthly support, strategy sprint then implementation, or long-term internal software partnership.
