

Level Intelligence OS - Detailed Proposition

Level Intelligence OS - Detailed Proposition

1. Executive Summary

Level X has the ingredients of a highly differentiated operating company: construction execution, development experience, hospitality knowledge, capital strategy, vendor relationships, and local market intelligence. The challenge is that much of this knowledge is not yet captured as software.

It lives in people, emails, spreadsheets, RFQs, project folders, permit threads, calls, meetings, and historical judgment. That is valuable, but it is fragile. It is difficult to search, difficult to hand off, difficult to measure, and difficult to improve systematically.

Level Intelligence OS would convert that operating knowledge into a private, agent-native system that Level owns and evolves.

The system would help Level:

- find opportunities earlier,
- qualify them more consistently,
- preserve relationship memory,
- coordinate RFQs and bids,
- track permits and entitlement risk,
- route decisions to the right people,
- maintain human control over consequential actions,
- create executive visibility,
- and build a compounding enterprise data asset.

The first phase should be a 90-day pilot focused on opportunity intelligence, relationship memory, RFQ workflow, qualification scoring, approval queues, and executive reporting.

The long-term opportunity is larger: Level builds an internal software layer that adapts through language and improves with every decision the company makes.

2. The Strategic Context

2.1 The Old Software Model

For the past decade, most companies have adopted specialized SaaS tools:

- CRM for relationships,
- project management for tasks,

- construction software for field operations,
- accounting systems for finance,
- spreadsheets for custom tracking,
- email for coordination,
- document storage for files,
- and dashboards for reporting.

These tools help, but they also fragment the operating picture. They force companies to translate real work into rigid fields and workflows. When the work changes, the software often lags.

In construction and development, this is especially painful because the highest-value information is often informal and language-heavy:

- “This owner is serious but slow to decide.”
- “This jurisdiction usually takes longer than advertised.”
- “This RFQ looks simple but the scope is incomplete.”
- “This brand is expanding in this market.”
- “This developer is early but well-capitalized.”
- “This subcontractor was cheap but caused downstream issues.”
- “This project type looks attractive but historically compresses margin.”

Traditional software struggles to capture that kind of knowledge.

2.2 The New Software Model

The new model is internal, adaptive, and language-native.

Instead of forcing every workflow into static software, companies can build internal operating layers that:

- read language,
- structure information,
- connect systems,
- support decisions,
- remember outcomes,
- and evolve through iteration.

Agents make this possible because they can operate in the messy middle between human communication and structured software.

They can:

- read an RFQ and extract requirements,
- summarize a permit comment,
- turn a meeting note into tasks,
- identify the owner, site, jurisdiction, and deadline in an email,
- draft a go/no-go memo,

- compare a new opportunity to past work,
- ask a human for missing information,
- route approvals,
- and remember what happened after the decision.

This is why the opportunity is not merely “AI automation.” It is building a new kind of internal software layer.

3. The Level-Specific Opportunity

Level is not just a construction company. Level’s operating surface spans:

- construction,
- development,
- hospitality,
- capital,
- vendor/subcontractor networks,
- relationships with owners and developers,
- brand/franchise opportunities,
- market intelligence,
- and executive decision-making.

This creates a broader opportunity than a standard construction dashboard.

Level Intelligence OS should become the connective tissue across the business.

3.1 Construction

Use cases:

- RFQ intake,
- bid qualification,
- scope summaries,
- bid deadline tracking,
- vendor/subcontractor memory,
- project handoff,
- selective integration with construction management systems.

3.2 Development

Use cases:

- site intelligence,
- title and ownership changes,
- planning agendas,
- rezoning activity,

- entitlement tracker,
- permit status,
- jurisdiction memory,
- feasibility next actions.

3.3 Hospitality

Use cases:

- acquisition and repositioning pipeline,
- hotel renovation tracking,
- brand/operator relationship memory,
- opening/stabilization workflows,
- project-to-operations handoff.

3.4 Capital

Use cases:

- financing milestones,
- investor communication support,
- opportunity underwriting workflow,
- development economics,
- capital partner relationship memory.

3.5 Executive Management

Use cases:

- weekly executive brief,
- pending decision queue,
- stalled pursuit alerts,
- pipeline by stage and market,
- relationship touch list,
- permit risk list,
- RFQ deadline summary,
- software rationalization insight.

4. What The System Would Do

4.1 Early Opportunity Intelligence

The system would monitor and ingest signals that may indicate future work.

Potential sources:

- permit filings,

- planning commission agendas,
- city council agendas,
- zoning and rezoning applications,
- title transfers,
- parcel ownership changes,
- commercial real estate news,
- franchise expansion announcements,
- hospitality development news,
- broker notes,
- inbound RFQs,
- CRM activity,
- email threads,
- internal relationship notes.

For each signal, the system would create or update a structured record:

- source,
- date,
- account,
- contact,
- site,
- market,
- asset type,
- jurisdiction,
- possible project type,
- confidence,
- recommended owner,
- recommended next action.

Value:

- Level sees opportunities earlier.
- Signals are not lost in emails or individual memory.
- Leadership can see market movement.
- BD can act before the opportunity becomes crowded.

4.2 Opportunity Graph

The system would connect information into a graph.

Objects:

- opportunity,
- account,

- contact,
- site,
- parcel,
- brand,
- operator,
- developer,
- jurisdiction,
- permit,
- RFQ,
- bid,
- vendor,
- project,
- investor,
- document,
- task,
- decision,
- approval,
- outcome.

Relationships:

- Account owns site.
- Contact works at account.
- Opportunity occurs at site.
- Permit belongs to site or project.
- RFQ belongs to opportunity.
- Bid belongs to RFQ.
- Vendor performed on prior project.
- Investor backs project.
- Decision belongs to opportunity.
- Outcome updates score logic.

Value:

- Level can search and reason across relationships.
- Institutional knowledge becomes connected.
- Agents can retrieve the right context before recommending action.

4.3 Qualification Engine

Each opportunity should be scored using Level-specific logic.

Score dimensions:

- geography fit,
- asset type fit,
- project size,
- timing,
- relationship strength,
- owner/developer quality,
- entitlement complexity,
- financing fit,
- construction margin potential,
- internal capacity,
- prior Level experience,
- competitive risk,
- strategic value.

Outputs:

- pursue/watch/pass recommendation,
- confidence score,
- reasoning,
- missing information,
- risks,
- next action,
- internal owner,
- comparable historical work.

Value:

- Better go/no-go discipline.
- Less time wasted on poor-fit opportunities.
- More consistent decision-making.
- Clearer learning from wins and losses.

4.4 Relationship Intelligence

The system would preserve relationship memory.

It should answer:

- Who do we know at this account?
- Who owns the relationship internally?
- When was the last touch?
- What projects have we done together?
- What is the relationship strength?
- What should we say next?

- Which opportunity is tied to this person?
- Which warm intro exists?

Value:

- Stronger follow-through.
- Less key-person dependency.
- Better onboarding.
- More consistent relationship management.

4.5 RFQ And Bid Workflow

RFQs are high-friction because they arrive as documents, emails, attachments, deadlines, scopes, and requirements.

The system would:

- ingest RFQs,
- summarize scope,
- extract deadlines,
- identify required attachments,
- detect missing documents,
- compare to past projects,
- draft go/no-go memo,
- create bid tasks,
- track clarifications,
- compare bids,
- and capture outcome.

Value:

- Faster bid triage.
- Fewer incomplete submissions.
- Better selectivity.
- Better use of historical knowledge.
- Stronger margin discipline.

4.6 Permit And Entitlement Workflow

Permit and entitlement workflows are often hidden in emails and portals.

The system would:

- track permit status,
- parse plan review comments,
- maintain communication history,

- identify action required,
- calculate days in review,
- compare to expected review time,
- draft follow-ups,
- flag blockers,
- and connect permit issues to project timelines.

Value:

- Earlier risk detection.
- Faster follow-up.
- Less time searching for status.
- Better jurisdiction memory.

4.7 Executive Operating View

The system would create a weekly operating rhythm.

Executive dashboard:

- top opportunities,
- new signals,
- high-value relationships,
- RFQs due soon,
- stalled pursuits,
- pending approvals,
- permit blockers,
- pipeline by market/stage,
- team workload,
- recent decisions,
- lessons learned.

Weekly brief:

- what changed,
- what matters,
- what is stuck,
- who owns the next action,
- what needs approval,
- what the system learned.

Value:

- Leadership sees exceptions.
- Fewer status-chasing meetings.

- Faster decisions.
- Better accountability.

5. Agentic Structure

The system should use specialist agents with defined roles, tools, and permissions.

5.1 Orchestrator Agent

The main router.

Responsibilities:

- understand user request,
- retrieve context,
- call specialist agents,
- enforce permission boundaries,
- synthesize answers,
- log activity.

5.2 Signal Scout Agent

Finds and triages signals.

Responsibilities:

- monitor sources,
- identify entities,
- dedupe,
- summarize evidence,
- create signal records,
- recommend owner,
- propose next action.

5.3 Qualification Agent

Scores opportunities.

Responsibilities:

- apply Level-specific score model,
- explain recommendation,
- compare to history,
- identify missing information,
- recommend pursue/watch/pass.

5.4 Relationship Agent

Builds account memory.

Responsibilities:

- generate account briefs,
- identify relationship owners,
- summarize history,
- suggest outreach,
- flag stale relationships.

5.5 RFQ/Bid Agent

Manages RFQ intelligence.

Responsibilities:

- summarize RFQs,
- extract requirements,
- detect missing documents,
- draft go/no-go memos,
- track bid tasks,
- compare bids.

5.6 Permit/Entitlement Agent

Manages jurisdictional risk.

Responsibilities:

- track permit status,
- summarize comments,
- draft follow-ups,
- flag overdue items,
- maintain jurisdiction memory.

5.7 Executive Briefing Agent

Creates leadership visibility.

Responsibilities:

- weekly brief,
- stalled pursuit list,
- pending decision queue,
- risk summary,
- market movement summary.

5.8 Finance/Capital Agent

Connects opportunity intelligence to economics.

Responsibilities:

- track financial assumptions,
- summarize financing milestones,
- identify margin risk,
- support investor updates,
- flag approval items.

6. Governance And Human Control

Agents should not silently make consequential decisions.

Authority model:

Level	Agent Authority	Examples
Autonomous	Can act and log	summarize RFQ, classify signal, draft brief
Suggest	Can propose action	create task, suggest owner, draft email
Approval Required	Human must approve	outreach, bid submission, vendor award, budget change
Manual	Human executes	contracts, financing, legal, final strategic decisions

Every approval should include:

- recommendation,
- reasoning,
- confidence,
- supporting evidence,
- approver,
- decision,
- notes,
- outcome,
- audit log.

This creates trust and protects the business.

7. ROI And Value Model

7.1 Operational ROI

Near-term value:

- fewer missed deadlines,
- faster RFQ review,

- less manual summarization,
- fewer status meetings,
- faster permit follow-up,
- clearer next actions.

7.2 Strategic ROI

Medium-term value:

- better opportunity selection,
- stronger relationship follow-through,
- better market visibility,
- better bid discipline,
- better cross-team coordination.

7.3 Enterprise Value ROI

Long-term value:

- proprietary operating dataset,
- institutional memory,
- reduced key-person dependency,
- better onboarding,
- internal software ownership,
- compounding decision intelligence.

7.4 Measurement Framework

Metrics:

- signals captured,
- time to first action,
- opportunities scored,
- go/no-go cycle time,
- RFQs processed,
- hours saved per RFQ,
- overdue RFQ reduction,
- permits past expected review,
- pending decisions by age,
- weekly brief adoption,
- win rate by source,
- margin by project type,
- recommendation override rate,
- outcome capture completeness.

8. Proposed 90-Day Pilot

8.1 Pilot Objective

Prove that Level Intelligence OS can create operational visibility, improve qualification, support RFQ workflows, and establish a compounding data asset.

8.2 Pilot Scope

- Active opportunity pipeline.
- Account and contact layer.
- Relationship memory.
- Signal inbox.
- Qualification scoring.
- RFQ intake.
- Go/no-go memo.
- Approval queue.
- Weekly executive brief.
- Outcome capture.

8.3 Pilot Timeline

Weeks 1-2: Foundation

Build:

- data model,
- authentication/roles,
- opportunity pipeline,
- account/contact database,
- active data import,
- executive view skeleton.

Weeks 3-5: Intelligence

Build:

- signal inbox,
- AI summaries,
- qualification scoring,
- relationship briefs,
- next action workflow,
- first weekly digest.

Weeks 6-8: Workflow

Build:

- RFQ intake,

- deadline extraction,
- go/no-go memo,
- approval queue,
- bid task tracking,
- permit tracker foundation.

Weeks 9-12: Operating Rhythm

Build:

- weekly executive brief,
- stuck decision reporting,
- outcome tracking,
- adoption process,
- phase-two roadmap.

8.4 Pilot Success Metrics

- 100 percent of active pursuits visible.
- Each pursuit has owner, stage, source, score, and next action.
- At least 10 new signals captured and reviewed.
- RFQs tracked with deadlines and status.
- Weekly executive brief generated from system data.
- Leadership identifies faster decisions or fewer blind spots.
- Phase-two integration roadmap approved or rejected with evidence.

9. Term Structure

9.1 Engagement

90-day pilot to design and build Level Intelligence OS v1.

9.2 Deliverables

- system architecture,
- data model,
- opportunity/account database,
- signal inbox,
- qualification engine,
- RFQ workflow,
- approval queue,
- executive brief,
- outcome capture,
- pilot report,
- phase-two roadmap.

9.3 Ownership Recommendation

Recommended structure:

- Level owns its data and generated operating memory.
- Level should have rights to export data at any time.
- Code ownership/licensing to be determined in agreement.
- AI providers are infrastructure and should remain replaceable.
- The strategic asset is Level's domain model, workflows, and data.

9.4 Commercial Options

Commercial model to decide after discovery:

- fixed-fee pilot,
- build fee plus monthly support,
- strategy sprint then implementation,
- long-term internal software partnership.

9.5 Phase-Two Options

Potential expansion:

- permit monitoring,
- email/calendar integration,
- CRM integration,
- Procore read-only sync,
- accounting/finance integration,
- vendor performance memory,
- investor reporting,
- software rationalization.

10. Why Level Should Care

This is a strategic asset, not only an efficiency tool.

If Level builds this now, it can own:

- its operating memory,
- its opportunity intelligence,
- its relationship graph,
- its qualification logic,
- its decision history,
- its agent workflows,
- and its software roadmap.

That creates a stronger company.

The near-term benefit is visibility and workflow. The long-term benefit is that Level's enterprise knowledge becomes structured, searchable, improvable, and increasingly valuable.
