

Level Intelligence OS

Comprehensive client packet for a private construction intelligence operating system built around Level's workflows, Procore reality, and operating judgment.

Commercial promise: outcomes, not just code

Code is the mechanism. The product is operating lift: cleaner opportunity visibility, faster RFQ triage, stronger go/no-go discipline, fewer missed follow-ups, a weekly executive decision rhythm, and Level-owned operating memory that compounds over time.

Packet Section	Purpose
1. Executive thesis	Why Level should own a private operating layer.
2. Pain before platform	Where scattered judgment creates drag.
3. Built for Level	Why this is not a vendor clone or replacement pitch.
4. Proven infrastructure	Reusable construction-platform primitives that lower build risk.
5. Procore bridge	How to wrap around the current source of truth before replacing anything.
6. Market shift	Why software is moving toward forward-deployed, company-specific systems.
7. Operating design	How find, qualify, route, convert, and learn becomes software.
8. Pilot and terms	How to prove value in 90 days and structure the engagement.

1. Executive Thesis

Level already has the hard part: trusted relationships, construction judgment, development instincts, hospitality experience, capital discipline, vendor memory, and practical pattern recognition about which opportunities are worth time.

The opportunity is to convert that judgment into a private operating system Level owns. This is not a generic AI layer, chatbot, dashboard, CRM migration, or forced Procore replacement. It is an internal operating layer around business development, preconstruction, project pursuit, development, hospitality, capital workflows, and executive management.

Near-Term Outcome	Long-Term Strategic Asset
Cleaner active pipeline, faster RFQ review, better go/no-go discipline, fewer missed follow-ups, and weekly executive visibility.	A Level-owned operating memory that improves pursuit, relationship leverage, execution handoff, and future software adaptability.

Core proposition
Level should not rent generic intelligence when it can build the operating memory that makes its own team sharper.

2. The Pain Before The Platform

The highest-value information in construction pursuit work rarely lives in one system. It lives in RFQs, emails, calls, spreadsheets, permit threads, broker notes, project folders, meeting notes, personal memory, and executive judgment.

Pain Point	What It Looks Like	Why It Matters
Scattered signals	Permits, planning activity, ownership changes, broker notes, franchise news, RFQs, and relationship tips arrive in different places.	Promising opportunities can be seen late, duplicated, or missed.
Trapped judgment	Fit, risk, timing, margin, and relationship context live in individual memory, inboxes, and informal notes.	Level's advantage is real but hard to search, compare, hand off, or improve.
RFQ friction	Deadlines, missing documents, addenda, site risk, scope ambiguity, and submission requirements are buried in language-heavy packages.	Teams spend time translating documents into tasks and may surface risk late.
Status burden	Leadership needs to ask what changed, what is stuck, who owns it, and what needs approval.	Executive time is spent assembling context instead of exercising judgment.

3. Built For Level, Not For The Category

Mercator and similar tools are useful category references because they show that earlier construction intelligence has value. But Level Intelligence OS is not a Mercator replacement pitch and not a vendor comparison exercise.

Generic Vendor Logic	Level Intelligence OS Logic
Expose market or project signals.	Expose signals and translate them into Level-specific opportunities, owners, scores, and next actions.
Use vendor-defined fields and workflows.	Represent Level's own domain model: accounts, contacts, sites, RFQs, permits, bids, approvals, relationships, and decisions.
Optimize for broad category adoption.	Optimize for Level's operating judgment, pursuit discipline, leadership rhythm, and long-term ownership.
Data remains mainly a tool output.	Data becomes Level-owned operating memory that compounds over time.

Positioning sentence
Level Intelligence OS is not built to compete with anyone else's product. It is built to make Level's own operating model software-native.

4. Proven Infrastructure Patterns We Bring

We are not starting from an empty page. The build can reuse internal construction-platform patterns already worked through in prior platform development while keeping the client-facing system fully Level-specific.

Pattern	How It Applies To Level
Construction domain model	Accounts, contacts, sites, projects, permits, RFQs, bids, budget items, approvals, outcomes, and operating notes become connected records.
Workflow state machines	Opportunities, RFQs, permits, approvals, and later vendor/payment workflows move through explicit statuses instead of scattered messages.
Specialist agent structure	Orchestrated agents handle bounded jobs such as signal intake, qualification, RFQ extraction, permit monitoring, executive briefing, and finance context.
Human-in-the-loop controls	Authority levels, approval queues, audit logs, escalation rules, and explicit human review keep consequential actions under Level control.
Document intelligence	RFQs, permits, invoices, emails, addenda, and project narratives become deadlines, risks, tasks, missing information, and decision memos.
Feedback loops	Wins, losses, overrides, delays, vendor outcomes, and cycle times become signals for better future recommendations.

5. Procore Bridge Strategy

Level Intelligence OS should wrap around Procore first, not replace it. Procore remains the execution source of truth while Level Intelligence OS becomes the intelligence, pursuit, RFQ, relationship, approval, and executive layer around it.

Phase	Position	Outcome
1. Read and reference	Treat Procore as the current project source of truth. Pull or reference only the data needed for visibility and decisions.	No disruption to field or project teams.
2. Workflow overlay	Use Level Intelligence OS for signals, RFQs, go/no-go memos, relationship memory, approvals, and executive briefs.	Level gains operating rhythm without forcing a platform migration.
3. Evidence-based rationalization	Measure which workflows are better handled inside Level's own system and which should stay in Procore.	Software decisions become based on observed value.
4. Selective replacement	Move modules away from monolithic software only when Level's owned layer is clearly better, safer, and cheaper to operate.	Dependency reduces over time without risky rip-and-replace.

Operating principle: earn the right to replace
The long-term goal is less reliance on monolithic software, but the first move is a Procore-first intelligence layer that creates measurable value now.

6. Market Shift: Forward-Deployed Software

The software market is moving from fixed SaaS screens toward company-specific AI systems deployed inside real workflows. OpenAI's 2026 Deployment Company and forward-deployed engineering model are a clear market signal: enterprise value increasingly comes from fitting intelligence into real operating constraints, not simply licensing a generic tool.

Shift	Old Pattern	New Pattern
Static SaaS to internal systems	The company adapts to vendor-defined screens and workflows.	Software adapts to the company's language, judgment, data, approvals, and operating rhythm.
Generic automation to agentic work	Rules handle narrow tasks but struggle with messy language-heavy work.	Agents read, synthesize, route, draft, and learn from RFQs, emails, permits, notes, and decisions.
Vendor lock-in to owned memory	Operating history lives inside external tools and exports.	The company's decisions, outcomes, and workflows become a proprietary asset.
Implementation to forward deployment	Software is installed and handed off.	Experts map work, ship inside real constraints, tune with operators, and turn adoption into measurable outcomes.
Manual change requests to language-native change	New workflows require slow product cycles or vendor roadmaps.	Teams can describe additions, omissions, and changes in natural language, then convert them into owned software modules.

Source note: OpenAI launched the OpenAI Deployment Company on May 11, 2026 and describes forward deployed engineering as a way to bring AI into production for complex real-world use cases.

7. What The System Does

Level Intelligence OS converts messy pursuit work into an operating loop: find, qualify, route, convert, and learn.

Capability	What It Does	Client-Facing Outcome
Find	Detects public and private project signals before they become obvious.	Level sees more opportunities earlier.
Qualify	Scores opportunities using Level's criteria, history, relationships, and capacity.	Leadership spends less time on poor-fit work.
Route	Assigns owners, next actions, approvals, and follow-ups.	Good opportunities do not stall in inboxes.
Convert	Supports RFQs, go/no-go memos, pursuit briefs, and executive reporting.	Level turns intelligence into action.
Learn	Captures decisions, overrides, wins, losses, delays, and outcomes.	Every cycle improves the next score, brief, and recommendation.

8. Product Modules

Module	What It Includes	Why It Matters
Signal inbox	Permits, planning agendas, title/ownership changes, rezoning, franchise expansion, broker notes, inbound RFQs, CRM/email activity.	Early signals become reviewable records instead of scattered noise.
Opportunity graph	Accounts, contacts, sites, jurisdictions, RFQs, bids, permits, decisions, owners, next actions.	Level sees relationships between people, projects, sites, and pursuits.
Qualification engine	Pursue/watch/pass, confidence, reasoning, missing info, risks, next action, owner, comparable history.	Level's own standards become repeatable without replacing human judgment.
Relationship memory	Relationship owner, last touch, prior work, warm intros, next follow-up, leadership brief.	Relationship context becomes searchable and actionable.
RFQ command center	Scope summary, deadlines, addenda, required attachments, missing documents, risks, go/no-go memo, bid tasks.	RFQs become decision-ready work.
Approval queue	Recommendations, evidence, confidence, approver, decision, outcome.	Agents prepare work while humans control consequential actions.
Executive brief	Top signals, active pursuits, stalled items, RFQs due, approvals needed, relationship follow-ups, lessons learned.	Leadership gets a weekly decision rhythm from live system data.

9. Agentic Operating Model

The system should be composed of specialist workflows under one governance model. This avoids the failure mode of one vague assistant that is expected to know everything.

Workflow Agent	Role
Signal Scout	Finds, dedupes, summarizes, and routes project signals.
Qualification	Scores opportunities against Level-specific criteria and explains the recommendation.
Relationship	Builds account/contact briefs, tracks owners, suggests follow-ups, and supports warm intros.
RFQ/Bid	Extracts requirements, deadlines, risks, missing documents, addenda, and go/no-go memos.
Permit/Entitlement	Tracks jurisdiction status, review comments, days in review, and hidden timing risk.
Executive Briefing	Turns system activity into a weekly decision brief.
Finance/Capital	Connects opportunities to financing, underwriting, investor context, and capital constraints where relevant.

10. Human Control And Trust

Authority Level	System Can Do	Human Control
Autonomous	Classify signals, summarize RFQs, dedupe contacts, draft internal briefs.	Logged for review.
Suggest	Recommend owner, next action, pursue/watch/pass, follow-up draft.	Human can accept, edit, or reject.
Approval Required	External outreach, bid submission, vendor award, budget change, investor communication.	Explicit approval required.
Manual	Legal, contracts, financing, final strategic decisions.	Human executes.

11. ROI And Value Model

The ROI should not be sold only as labor savings. The bigger value is better pursuit discipline, faster decisions, fewer blind spots, stronger relationship leverage, and proprietary operating memory.

Value Lever	How Value Is Created	How To Measure
Opportunity capture	Signals become structured opportunities with owner, score, source, and next action.	Signals captured, time to first action, conversion by source, wins by source.
Pursuit discipline	Low-fit pursuits are filtered earlier while high-fit work receives faster attention.	Go/no-go cycle time, win rate by score, avoided pursuit hours, margin by source.
Admin reduction	Agents summarize, extract, draft, route, and remind across language-heavy workflows.	Hours saved per RFQ, weekly report time saved, overdue task reduction.
Risk reduction	Permits, missing documents, stalled decisions, and deadline risk surface sooner.	Missed deadline rate, response time, unresolved blocker age.
Enterprise asset	Relationships, decisions, outcomes, vendors, and market patterns become private memory.	Record completeness, reuse of history, recommendation accuracy, override rate.

Compounding logic

Each signal, decision, win, loss, permit delay, vendor outcome, and relationship touch improves the next recommendation.

12. 90-Day Pilot

The pilot should prove usefulness in workflows Level already runs: opportunity review, RFQ triage, relationship follow-up, approval routing, and executive reporting.

Period	Focus	Client-Visible Deliverable
Weeks 1-2	Foundation	Data model, roles, active opportunities, account/contact layer, executive dashboard skeleton.
Weeks 3-5	Intelligence	Signal inbox, opportunity summaries, qualification scoring, relationship briefs, first weekly digest.
Weeks 6-8	Workflow	RFQ command center, deadline extraction, go/no-go memo, approval queue, bid task tracking.
Weeks 9-12	Operating rhythm	Weekly executive brief, outcome tracking, adoption review, phase-two roadmap.

Pilot Success Metrics

- 100 percent of active pursuits visible in the system.
- Each pursuit has owner, stage, source, score, next action, and age.
- At least 10 useful signals captured, reviewed, and routed.
- RFQs tracked with deadlines, requirements, and go/no-go status.
- Weekly executive brief generated from live system data.
- Leadership identifies faster decisions, fewer blind spots, or clearer accountability.
- Phase-two roadmap is based on observed value, not assumptions.

13. Phase Two And System Expansion

Expansion should be based on where Level sees the highest operating value during the pilot, not a preset software wish list.

Expansion Area	Potential Scope
Permit and entitlement monitoring	Jurisdiction status, comments, timing risk, follow-up drafts, days in review.
Email, calendar, CRM, storage integration	Source access, relationship context, meeting history, follow-up capture.
Procore read-only bridge	Treat Procore as the current project source of truth while Level Intelligence OS adds intelligence, pursuit, and executive workflow above it.
Vendor and subcontractor memory	Performance history, issue patterns, pricing, reliability, project outcomes.
Project handoff	Transfer pursuit context into execution planning and kickoff.
Finance and capital workflow	Underwriting context, investor notes, financing constraints, capital approval support.
Hospitality pipeline	Brand/operator tracking, franchise expansion, site qualification, relationship history.
Software rationalization	Usage audit to decide what should remain, integrate, downgrade, or eventually be replaced by Level-owned modules.

14. Commercial, Ownership, And Trust Principles

Area	Recommended Position
Engagement	90-day pilot to design, build, test, and operationalize Level Intelligence OS v1.
Pilot deliverables	Workflow map, data model, opportunity/account/contact database, signal inbox, scoring framework, Procore-first bridge strategy, RFQ workflow, approval queue, weekly executive brief, success report, phase-two roadmap.
Ownership	Level owns its data, operating memory, domain model, workflow definitions, and exportable generated records. Code ownership/licensing to be defined in the final agreement.
Model infrastructure	AI model providers remain replaceable infrastructure, not the strategic asset.
Confidentiality	Level data is confidential. No external reuse without written permission. Role-based access and audit logs are required.
Human approval	External outreach, bid submission, vendor award, budget change, investor communication, legal, financing, and final strategic decisions require human control.
Commercial options	Fixed-fee pilot, build fee plus monthly operating retainer, strategy/design sprint followed by implementation, or long-term internal software partnership.

15. Discovery Agenda

The first discovery session should focus on actual workflow, not abstract AI strategy.

Discovery Topic	Questions To Answer
Opportunity sources	Where do new opportunities originate today? Which sources matter most?
Qualification criteria	What makes a Level opportunity attractive or unattractive? Who decides?
RFQ workflow	Where do RFQs live? How are deadlines, addenda, tasks, and go/no-go decisions handled?
Relationship memory	Which accounts, contacts, owners, brands, developers, and vendors matter most?
Executive reporting	What does leadership need to see every week? What is currently hard to assemble?
Systems and data	Which tools are in use today: Procore, CRM, email, calendar, accounting, storage? What should be read, synced, imported, or left alone?
Approval rules	Which actions require explicit approval? Who approves them?
Pilot success	What would make the pilot obviously worth continuing?

Recommended next step

Run a 60-minute workflow discovery session, collect sample RFQs and current active pursuits, then finalize the pilot scope and commercial structure.

16. Closing Position

Level Intelligence OS should be presented as a serious operating asset, not an AI experiment.

The first version gives Level one place to see opportunities, understand fit, track RFQs, preserve relationship memory, and route decisions. The longer-term version becomes Level's private construction intelligence layer: a system that learns from Level's signals, relationships, decisions, wins, losses, and operating judgment.

Final message

Level can build internal software that grows with the company, adapts through language, and compounds from its own operating history.

Immediate Ask	Approve a focused 90-day pilot.
What Level Gets	A working operating rhythm, not a codebase sitting on a shelf.
Why It Matters	The software becomes more valuable because it learns Level.
