

OFFICIAL DOSSIER

Level Intelligence OS

A private construction intelligence operating system for finding, qualifying, routing, and converting opportunities through Level's own operating judgment.

Executive Summary

Level Construction already has the hard part: trusted relationships, commercial construction judgment, development instincts, hospitality experience, capital discipline, and a practical sense for which opportunities are worth time. The opportunity is to turn that judgment into a private operating system that Level owns.

This is not a generic dashboard, chatbot, CRM migration, or forced Procore replacement. It is a working operating layer around Level's business development, preconstruction, project pursuit, development, hospitality, and capital workflows.

This is not built to compete with Mercator or clone any vendor. It is built from the ground up around Level's own relationships, standards, RFQs, approvals, markets, capital context, and operating judgment.

The near-term outcome is cleaner visibility and faster decisions. The long-term outcome is a proprietary operating memory that improves every time Level reviews a signal, pursues an opportunity, wins a job, passes on a poor-fit project, or learns from execution.

The Business Problem

Level's advantage is operational, but much of that advantage still lives in places that software cannot easily use: emails, RFQ packages, attachments, bid notes, permit comments, spreadsheets, project folders, meeting notes, calls, relationship memory, and executive judgment.

Pain	What It Creates
Scattered signals	Early project, permit, planning, ownership, franchise, broker, and RFQ signals arrive in different places.
Trapped judgment	Fit, risk, timing, margin, and relationship context live in individual memory and informal notes.
RFQ friction	Deadlines, missing requirements, scope questions, and go/no-go reasoning are buried in language-heavy packages.
Status burden	Leadership spends time assembling context instead of making decisions.

Outcomes, Not Just Code

We give you outcomes, not just code. Code is the mechanism. The product is operating lift: cleaner pipeline visibility, faster triage, better RFQ discipline, fewer missed follow-ups, a weekly executive decision rhythm, and reusable enterprise memory.

Outcome	What Changes
Pipeline visibility	Active pursuits have owner, stage, score, source, next action, and age.
RFQ discipline	Deadlines, requirements, missing information, and go/no-go reasoning are extracted and routed.
Decision speed	Approvals and exceptions surface before they become bottlenecks.
Executive rhythm	Leadership gets a weekly brief from live system data.
Enterprise memory	Signals, decisions, outcomes, and overrides improve the next cycle.

What The System Does

System Area	Client-Facing Outcome
Signal inbox	Early project, permit, planning, ownership, franchise, broker, and RFQ signals captured in one place.
Opportunity graph	Accounts, contacts, sites, jurisdictions, RFQs, bids, permits, and decisions connected.
Qualification engine	Pursue, watch, or pass recommendations based on Level-specific fit criteria.
Relationship memory	Searchable account/contact context, relationship owners, last touch, and next follow-up.
RFQ command center	Scope summaries, deadlines, missing requirements, go/no-go memos, and bid tasks.
Approval queue	Consequential actions routed to humans before external movement.
Executive brief	Weekly view of what changed, what is stuck, what needs action, and what leadership must decide.

Human Control And Trust

Authority Level	System Can Do	Human Control
Autonomous	Classify signals, summarize RFQs, dedupe contacts, draft briefs.	Logged for review.
Suggest	Recommend owner, next action, pursue/watch/pass, follow-up draft.	Human can accept or edit.
Approval Required	External outreach, bid submission, vendor award, budget change, investor communication.	Explicit approval required.
Manual	Legal, contract, financing, final strategic decisions.	Human executes.

Procore-First Bridge

The recommended first move is to wrap around Procore, not replace it. Procore can remain the execution source of truth while Level Intelligence OS becomes the intelligence, pursuit, RFQ, relationship, approval, and executive layer around it.

Now	Later
Read and reference Procore data where it improves visibility, without disrupting active project teams.	Use observed value to decide which workflows should remain in Procore and which can move into Level-owned software.
Structure Level Intelligence OS around current tools, current approvals, and current operating reality.	Reduce monolith dependence module by module after the internal layer proves better fit, lower friction, and clear ROI.

Proven Internal Patterns

The build can reuse known construction-platform primitives: connected domain models, workflow state machines, approval queues, document extraction, specialist agent handoffs, audit logs, role-specific dashboards, and feedback loops from outcomes.

This lowers build risk while keeping the client-facing system fully Level-specific.

90-Day Pilot

Objective: prove that Level Intelligence OS improves opportunity visibility, qualification discipline, RFQ coordination, executive reporting, and institutional memory.

Period	Focus	Deliverable
Weeks 1-2	Foundation	Data model, roles, active opportunity/account/contact views, executive dashboard skeleton.
Weeks 3-5	Intelligence	Signal inbox, opportunity summaries, qualification scoring, relationship briefs, first weekly digest.
Weeks 6-8	Workflow	RFQ command center, deadline extraction, go/no-go memo, approval queue, bid task tracking.
Weeks 9-12	Operating rhythm	Weekly executive brief, outcome capture, adoption review, phase-two roadmap.

Pilot Success Metrics

- 100 percent of active pursuits visible with owner, stage, source, score, next action, and age.
- At least 10 useful signals captured, reviewed, and routed.
- RFQs tracked with deadlines, requirements, and go/no-go status.
- Weekly executive brief generated from live system data.
- Leadership can point to faster decisions, fewer blind spots, or clearer accountability.
- Phase-two roadmap is based on observed value, not assumptions.

Commercial And Ownership Principles

Area	Recommended Position
Engagement	90-day pilot for a private, Level-specific construction intelligence operating system.
Pilot deliverables	Data model, opportunity/contact database, signal inbox, scoring framework, RFQ workflow, approval queue, weekly executive brief, success report, phase-two roadmap.
Ownership	Level owns its data, operating memory, domain model, workflow definitions, and exportable generated records. Code ownership/licensing to be defined in the final agreement.
Confidentiality	Level data is confidential. No external reuse without written permission. Role-based access and audit logging required.
Commercial structure	Fixed-fee pilot, build fee plus monthly operating retainer, strategy/design sprint followed by implementation, or long-term internal software partnership.

Closing Position

The first version gives Level cleaner visibility and faster decisions. The strategic version gives Level a proprietary operating memory that improves how the company finds, qualifies, wins, and executes work.

Level should not rent generic intelligence when it can build the operating memory that makes its own team sharper.
